

Small Office COMMUNICATIONS *finally* Simplified

Jazinga™ combines the features of a high-end, corporate telephone system with wireless networking and e-mail - at a fraction of the cost and with unprecedented ease of setup and use.

Big Ambitions

You don't have a large staff and big budgets, but effective communication is undoubtedly a key aspect of your operations.

Big companies have long enjoyed the multitude of features that come with corporate phone systems, network routers/hubs and dedicated maintenance staff. But this functionality has eluded small offices due to the high cost of purchasing, implementing and maintaining these various technologies.

It Needs to Be Simple & Affordable

Jazinga set out to tackle this disparity with a communication solution designed for small businesses and homes in a single easily-installable product. Jazinga is a fully functional network router and telephony

system in a single appliance that requires little more than plugging in to operate.

It has common telephone system features such as auto-attendant, voicemail, conferencing, intercom, call forwarding, on-hold music and much more.

Plus, you can finally begin to reap the benefits of true unified communications with a solution enabling you to manage voice messages from your e-mail.

If you do not yet have a Internet-based (VoIP) phone service provider, the system will help you select a vendor, sign up, and implement the service with little fuss.

The Jazinga solution will enable you to look like a bigger company to the outside world with features such as automated attendant, company directory, departmental mailboxes and the ability to integrate remote users.

Key Features:

- Hybrid IP/Traditional PBX
- Automated Call Distribution
- WiFi/Ethernet Router
- Unified Communications
- "Do-it-yourself" simple set up
- Plus much more...

Integrated telephony and networking system for small/home offices

Easy Setup

The telephone system, networking and e-mail integration can be set up with no more technical expertise than it takes to start up a new PC. For example, there are three basic steps to setting up your phone system for the first time:

- 1 Add your users
- 2 Record the automated attendant (IVR)
- 3 Add your phone number and routing choices

So easy to install, in fact, that you won't need an IT person to configure and maintain the system for you.

.....

Take Advantage of VoIP

Jazinga supports traditional (PSTN) and Internet-based (VoIP) telephones and lines - enabling long distance savings and the ability to utilize one network for voice and data.

With Jazinga, you simply plug the cables into the appliance, plug your IP phones into their network, and the configuration is automatic. And because Jazinga is also the network router, voice traffic is prioritized, ensuring call quality.

.....

Operate Like a Big Company

Make your company look larger with features like automated attendant (IVR), distinctive ring and departmental mailboxes. And, enjoy the efficiencies of a larger organization with the ability to follow a simple web interface to assign outbound calls to various long distance plans which are optimized to save your company money.

Jazinga is an extensible platform enabling the addition and administration of new applications, features and services. For example, Jazinga can be complemented with hosted backup, domain, DNS and e-mail services.

.....

How to Buy

Currently, the Jazinga product is available only through authorized resellers and Internet Service Providers. For more information, please email sales@jazinga.com or call 1-416-548-4755.

Jazinga creates products for SOHO businesses that provide enterprise telephony and data functionality but are designed with unprecedented ease of setup and use.
